

AIRPORT FLIGHT BOARD & SCHEDULER

Java-Based Flight Information Management System

- The Airport Flight Board & Scheduler is a Java application used to manage airport flight information.
- It displays arrivals and departures in an organized flight board.
- Staff can add flight details and update the flight status.

- Manual flight information management can be time-consuming.
- Flight status changes may not be updated quickly.
- Searching for a particular flight can be difficult.
- An organized digital system helps provide updated information.

- Add and store flight schedules.
- Update statuses such as Scheduled, Boarding, Departed, Arrived, Delayed and Cancelled.
- Search for flights using the flight number.
- Display flight information clearly on the flight board.

- Add Flight – Enter flight number, airline, source, destination and timing.
- Update Status – Change the current flight status.
- Search Flight – Find a flight using its flight number.
- Show Flight Board – Display all available flight details.

- Programming Language: Java
- Input: Scanner
- Selection: if-else and switch-case
- Iteration: for loop and while loop
- Arrays and methods are used to store and manage flight data.

- The project provides a simple way to manage and display airport flight information.
- It reduces manual work and makes flight status updates easier.
- The project demonstrates Java programming concepts in a practical application.
